

Sorting Hat

In this project you will make a Sorting Hat that will put you in one of the Hogwarts school houses based on what you say.

Your class will work together to teach the computer to recognise how students in different houses speak by giving it examples of dialogue from the books.

The idea for this project came from Ryan Anderson, who made a real-life sorting hat with his daughter!

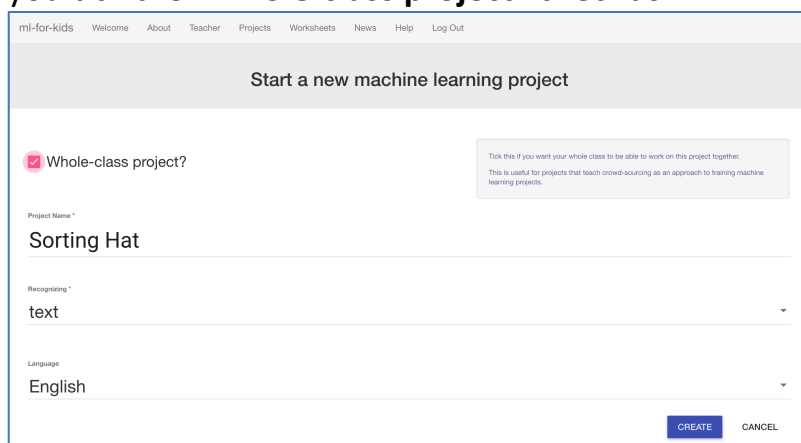

<https://www.ibm.com/blogs/think/2016/06/watson-sorting-hat/>

Teacher / Group leader instructions : Setup

This version of the “Sorting Hat” activity will get your class to work together to train a single machine learning model. A version of this activity where students can work individually to each train their own machine learning can be downloaded from <https://machinelearningforkids.co.uk/worksheets>

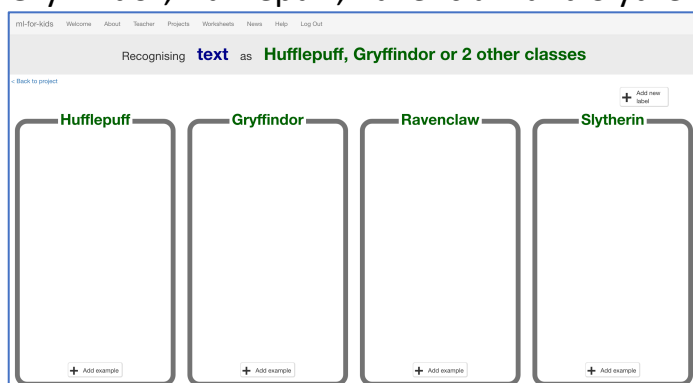

Objective: Create a group project & prepare it for use by your class

1. Go to <https://machinelearningforkids.co.uk/> in a web browser
2. Login using your teacher username/password
3. Click on “**Projects**” in the top menu bar
4. Click on the “**+ Add a new project**” button
5. Create a project called “Sorting Hat”, set to recognise “**text**” and make sure you tick the “**Whole-class project**” checkbox

The screenshot shows the 'Start a new machine learning project' form. At the top, there is a navigation bar with links: ml-for-kids, Welcome, About, Teacher, Projects, Worksheets, News, Help, Log Out. The form title is 'Start a new machine learning project'. Below the title, there is a checkbox labeled 'Whole-class project?' which is checked. To the right of the checkbox, there is a small text box that says: 'Tick this if you want your whole class to be able to work on this project together. This is useful for projects that teach crowd-sourcing as an approach to training machine learning projects.' Below the checkbox, there is a text input field for 'Project Name' with the value 'Sorting Hat'. Below that, there is a dropdown menu for 'Recognising' with the value 'text'. Below that, there is a dropdown menu for 'Language' with the value 'English'. At the bottom right of the form, there are two buttons: 'CREATE' and 'CANCEL'.

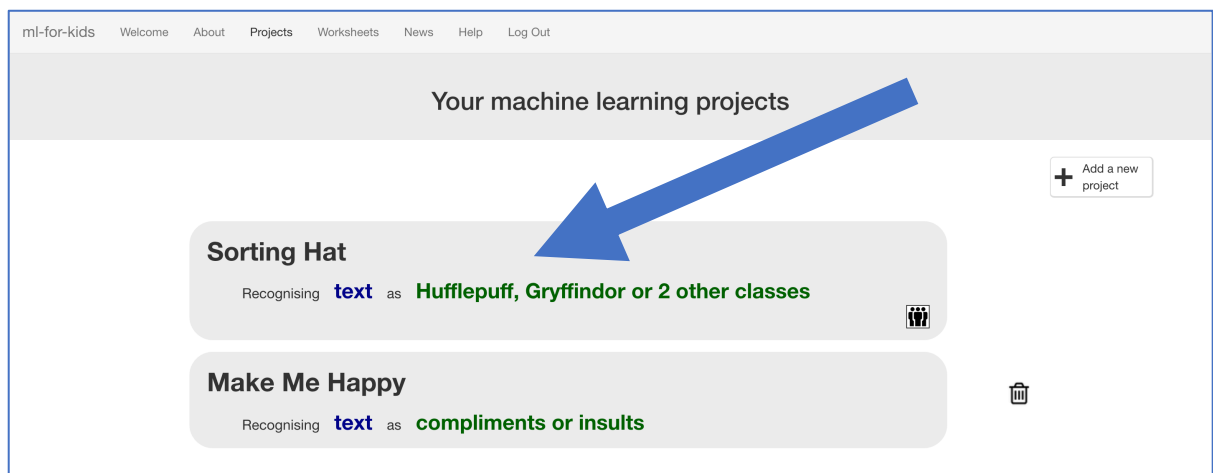

6. Click “**Create**”
7. Click on the “Sorting Hat” project in the list, and then click “**Train**”
8. Use the “**+ Add new label**” button to create four training buckets for Gryffindor, Hufflepuff, Ravenclaw and Slytherin

The screenshot shows the 'Sorting Hat' project training interface. At the top, there is a navigation bar with links: ml-for-kids, Welcome, About, Teacher, Projects, Worksheets, News, Help, Log Out. Below the navigation bar, there is a header that says 'Recognising text as Hufflepuff, Gryffindor or 2 other classes'. Below the header, there is a button labeled 'Back to project'. Below that, there are four empty boxes representing training buckets, each with a label above it: 'Hufflepuff', 'Gryffindor', 'Ravenclaw', and 'Slytherin'. Each box has a '+ Add example' button at the bottom. At the top right of the buckets, there is a '+ Add new label' button.

Student instructions

1. You will need some Harry Potter books for this project.
Go to the school library!
2. Go to <https://machinelearningforkids.co.uk/> in a web browser
3. Click on “**Get started**”
4. Click on “**Log In**” and type in your username and password
If you don’t have a username, ask your teacher or group leader to create one for you.
If you can’t remember your username or password, ask your teacher or group leader to reset it for you.
5. Click on “**Projects**” on the top menu bar
6. You should see a “Sorting Hat” project created by your teacher.
Click on it.

7. Click the “**Train**” button to start collecting examples of quotes to train the computer with.

8. Your teacher has prepared training buckets for each of the school houses in the Harry Potter stories.

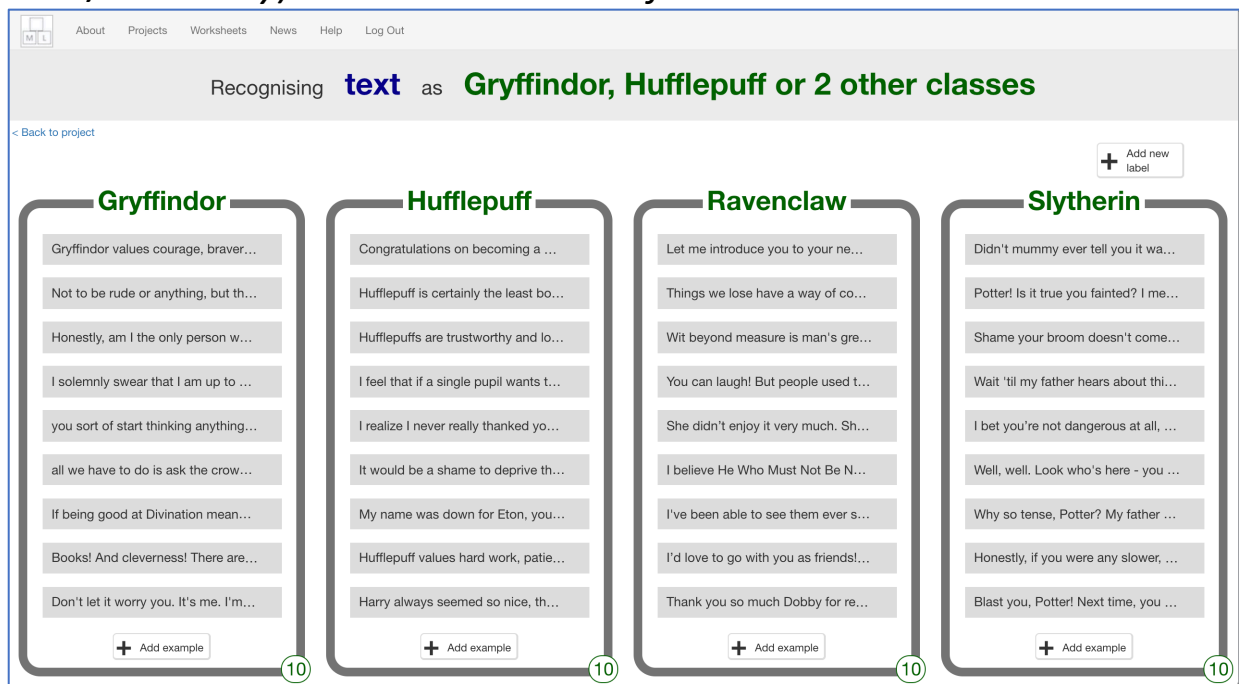

The screenshot shows the 'ml-for-kids' website interface. At the top, there is a navigation bar with links: 'Welcome', 'About', 'Projects', 'Worksheets', 'News', 'Help', and 'Log Out'. Below this, a header section reads 'Recognising text as Hufflepuff, Gryffindor or 2 other classes'. A link '< Back to project' is on the left. The main area contains four large, empty rectangular boxes, each representing a training bucket. Above each box is a label: 'Hufflepuff', 'Gryffindor', 'Ravenclaw', and 'Slytherin'. At the bottom of each box is a button with a plus sign and the text 'Add example'.

9. Click on the “+ Add example” button in the “Gryffindor” bucket. Find a quote by Harry Potter and type it into the box. Click “Add”

This screenshot shows the same interface as the previous one, but with a modal dialog box open over the 'Gryffindor' bucket. The dialog is titled 'Add new example' and has a blue header. Below the title, it says 'Enter an example of 'Gryffindor'' with a red asterisk. A text input field contains the quote: '...but this isn't really a great time for me to have a House Elf in my bedroom'. To the right of the text is a character count '103 / 1000'. At the bottom of the dialog are two buttons: 'ADD' and 'CANCEL'. The background interface is dimmed.

10. Add quotes for characters from each of the other three school houses in the same way, by clicking on “+ Add example”.

11. Keep going, collecting examples of quotes for each of the houses. *If your computer screen is big enough, you can press Ctrl and – (the dash/minus key) at the same time to fit more on the screen.*

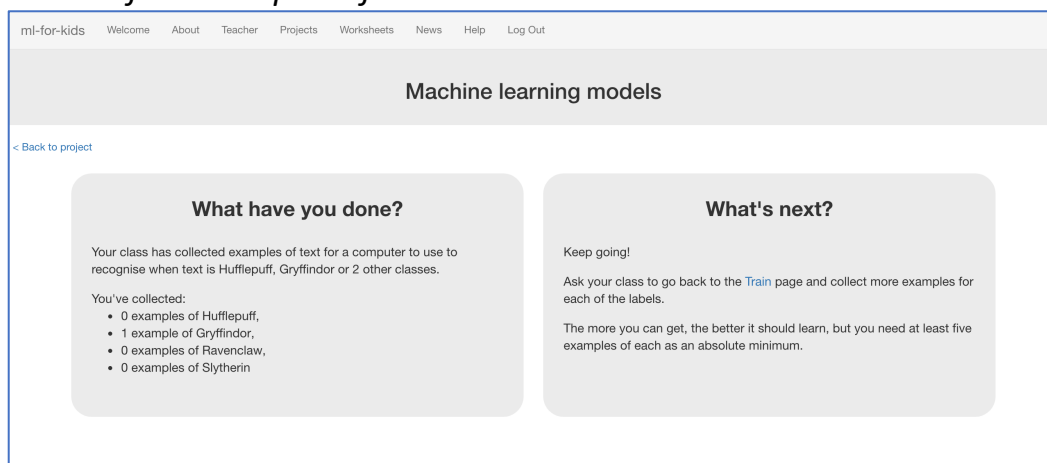

12. Your classmates will also be adding quotes to the same training buckets as you, but they won't show up while you've got the page open. *Refresh the page to see all the training so far from the whole class.*

13. Keep going until your class have collected enough examples. **Don't move past this step until your teacher tells you that it is time to move on.**

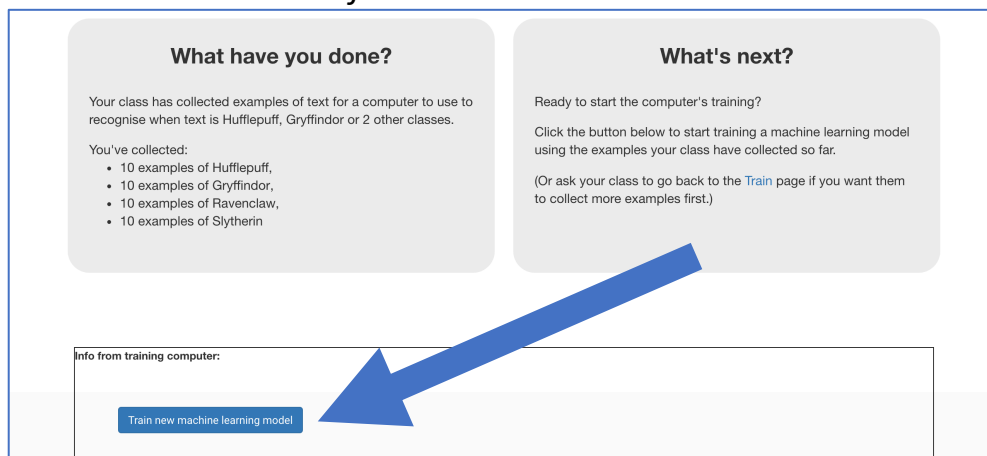

Teacher / Group leader instructions : Train a ML model

Objective: Monitor class progress & train a machine learning model

1. Click on **“Projects”** in the top menu bar
2. Click on the **“Sorting Hat”** project
3. Click on the **“Learn & Test”** button
4. Review the summary of the progress the class has made
The more examples they collect, the better the model should perform but they need at least five examples of each house to be able to create a model at all.

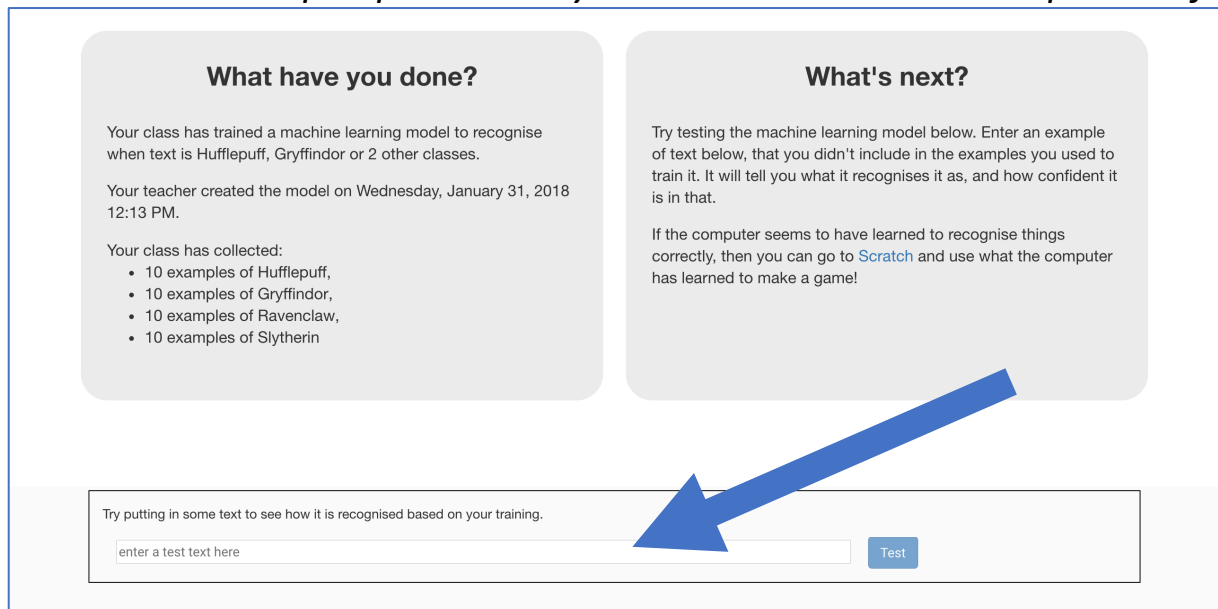

5. When you're ready to proceed, click **“Train new machine learning model”** to train a new model using their examples.
This may take a minute or two. The status on the page will change from “Training” to “Active” once it has finished.

6. Once it is ready, you can tell the class it's time to move on.

Student instructions

14. Click on the “< Back to project” link.
15. Your teacher has used the examples your class collected to train a machine learning model. To try it out click on “**Learn & Test**”
16. As long as the training has finished, a Test box will be displayed. Try testing your machine learning model to see what the computer has learned.
Test it with example quotes that you haven't shown the computer before.

The screenshot shows a web interface with two main columns. The left column, titled 'What have you done?', contains text about training a model to recognize Harry Potter house names (Hufflepuff, Gryffindor, Ravenclaw, Slytherin) based on 40 examples. It also shows the creation date and time. The right column, titled 'What's next?', instructs the user to test the model with new text and mentions a 'Scratch' button for using the model in a game. At the bottom, there is a text input field with the placeholder 'enter a test text here' and a blue 'Test' button. A large blue arrow points from the 'What's next?' section down to the 'Test' button.

What have you done?

Your class has trained a machine learning model to recognise when text is Hufflepuff, Gryffindor or 2 other classes.

Your teacher created the model on Wednesday, January 31, 2018 12:13 PM.

Your class has collected:

- 10 examples of Hufflepuff,
- 10 examples of Gryffindor,
- 10 examples of Ravenclaw,
- 10 examples of Slytherin

What's next?

Try testing the machine learning model below. Enter an example of text below, that you didn't include in the examples you used to train it. It will tell you what it recognises it as, and how confident it is in that.

If the computer seems to have learned to recognise things correctly, then you can go to [Scratch](#) and use what the computer has learned to make a game!

Try putting in some text to see how it is recognised based on your training.

17. Click the “< Back to project” link
18. Click the “**Make**” button
19. Click the “**Scratch**” button

What have you done so far?

You've started to train a computer to recognise the use of language by different characters in the Harry Potter books.

These examples are being used to train a machine learning “model”.

This is called “supervised learning” because of the way you are supervising the computer’s training.

The computer will learn from patterns in the examples you’ve given it, such as the choice of words, and the way that sentences are structured.

These will be used to be able to make predictions about people not in the book, just like the Sorting Hat does.

Don't worry if your model seems to get a lot wrong. With only a handful of examples of each house, the computer won't have had very much to learn from yet. If you were doing this for real, you'd be collecting dozens or hundreds of examples for the computer to train on.

20. Click the “Open in Scratch” button

[< Back to project](#)

Your project will add these blocks to the **More Blocks** tab in Scripts.

recognise text **text** (label)

Put text in the input for this, and it will return the label that your machine learning model recognises it as.

recognise text **text** (confidence)

This will return how confident your machine learning model is that it recognises the type of text. (As a number from 0 - 100).

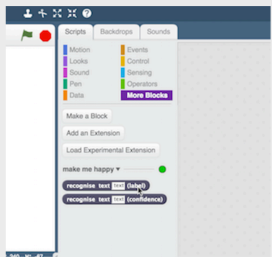

Gryffindor **Hufflepuff** **Ravenclaw** **Slytherin**

These blocks represent the labels you've created in your project, so you can use their names in your scripts.

This means you can do something like this:

```
ask enter some text here and wait
if recognise text (answer) (label) = Gryffindor then
say I think that was Gryffindor
```

It will look something like this - except with the name of your project.

The coloured circle next to your project name tells you if your machine learning model is okay.

- means your model is trained and ready to go
- means your model hasn't finished training yet
- means something went wrong. Go back to the [Learn & Test](#) page to see what went wrong with training.

Tips

More examples!

The more examples you give it, the better the computer should get at recognising what the different school houses have in common.

Try and be even

Try and come up with roughly the same number of examples for each House.

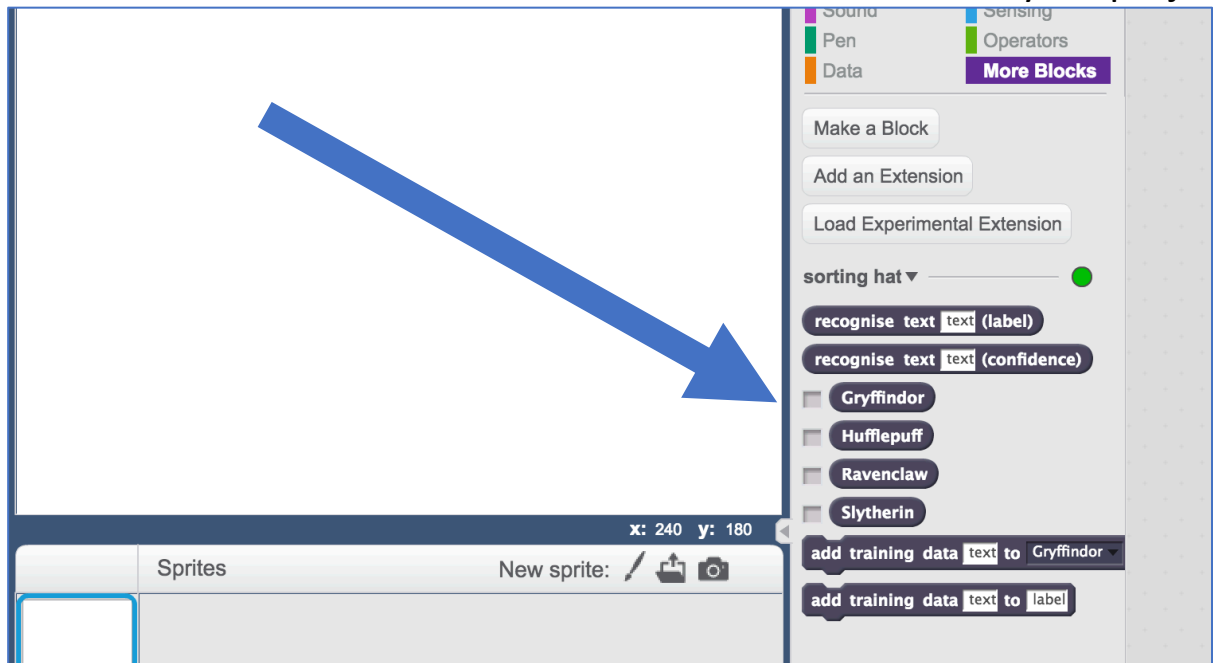

This can be difficult – particularly for Hufflepuff! But try not to focus only on Gryffindor and Slytherin.

If you have a lot of examples for some houses, and not the others, the computer might learn that being in those houses is more likely than the others. That would probably affect the predictions that it makes.

Quotes online

If you're struggling, or you don't have a copy of a Harry Potter book available, try searching for quotes of your favourite characters online.

- 21.** You should see blocks in “More blocks” section from your project.

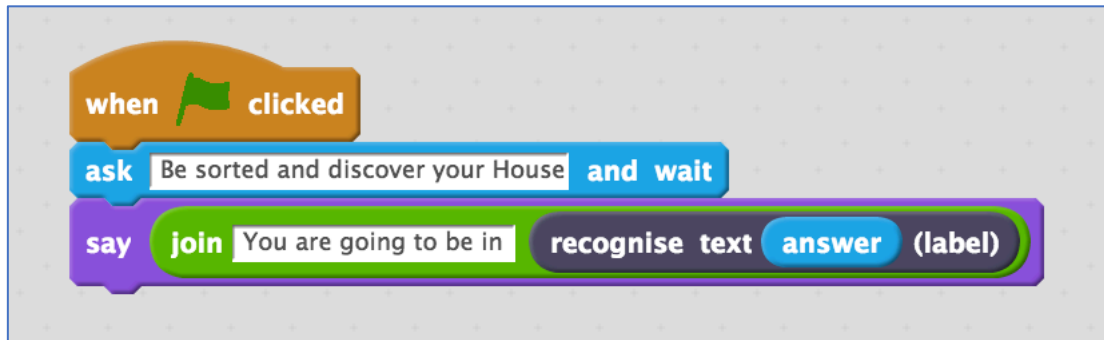

- 22.** Create a new sprite by clicking on the paint brush icon next to “New sprite”, just below the white canvas.

- ## 23. Draw a Sorting Hat

If you really don't like drawing, you could find a picture of the Sorting Hat online, and use that instead. Click on the folder icon next to the paintbrush to import a sprite from a file.

24. Click the “**Scripts**” tab, and enter the following script.

25. Save your project
Click **File** -> **Save Project**

26. Test your script!
Click on the **green flag**, and type in a message.
Try typing in something that you would say, or something you have said and see which House the Sorting Hat would put you in!
Try it on your friends and see what House the Hat would put them in.

The idea for this project came from Ryan Anderson, who made a real-life sorting hat with his daughter!

Instead of typing messages to it, they also used speech-to-text so that they could actually talk to their Hat. Once they converted people's voices into text, they trained a machine learning model to be able to recognise which House that should be, in a similar way to you have.

To see what the Hat looked like in action, check out their video at

<https://youtu.be/tSHoJoOOi9k>

What have you done?

You've created a Scratch game version of the Harry Potter Sorting Hat, using machine learning.

You trained that machine learning model by collecting examples of quotes from characters, and telling the computer which House they are in.

You've seen that doing this well is difficult, and needs a lot of examples.

But even with a small number of examples, it's fun to see the patterns that the computer learns, and how it tries to use that to recognise new text.

The idea for this project came from Ryan Anderson, who made a real-life sorting hat with his daughter!

Instead of typing messages to it, they also used speech-to-text so that they could actually talk to their Hat. Once they converted people's voices into text, they trained a machine learning model to be able to recognise which House that should be, in a similar way to you have.
